EDUCATION

Purdue University

Bachelor of Science in Computer Science

West Lafayette, IN

Aug. 2024 – May 2028

Concentration: Systems Software

Relevant Coursework: Data Structures & Algorithms, Systems Programming, Computer Architecture, Object-Oriented Programming, Programming in C, Linear Algebra, Discrete Math

EXPERIENCE

Lynco Products

Full Stack Software Engineer Intern

Quad Cities Metro Area

June 2026 – Aug. 2026

- Built and shipped internal React tools to production, including a shipping rate engine that queries carrier APIs and picks the lowest-cost carrier per order by shipment size and quantity, replacing manual comparison across vendors.
- Brought production SQL stored procedures under version control, replacing untracked database logic with a reviewable, rollback-capable change history.
- Provisioned an in-house Debian development server for a five-person team with LDAP auth and Samba shares, pinning per-project Node toolchains with Volta so legacy React apps run alongside newer code.

BoilerMake

Outreach Team Lead

West Lafayette, IN

April 2025 – Present

- Grew engagement 1.5× year-over-year for BoilerMake, Purdue's flagship 500-person hackathon; lead a six-person outreach team.
- Analyzed 1,000+ applications to identify demographic gaps by major, year, and school, then redirected outreach toward the untapped pools surfaced.
- Built an internal tool that scrapes exam schedules and other CS club calendars to surface conflict-free windows for hosting workshops and events.

Purdue Grand Prix Foundation

Development/Ticketing Lead

West Lafayette, IN

Sept. 2025 – Present

- Diagnosed gate-entry and ticketing inefficiencies costing the foundation third-party fees, then led design and build of an in-house replacement for the 3,000-attendee event.

PROJECTS

Event Ticketing System | *Python, FastAPI, PostgreSQL, Docker, Stripe, Ed25519*

Oct. 2025 – Present

- Built an end-to-end ticketing platform for Purdue Grand Prix (3,000 attendees) to replace third-party ticketing, projected to eliminate roughly \$1,500 in processing fees at current volume.
- Designed offline-validatable tickets using Ed25519 signatures, letting gate scanners verify authenticity with no network connectivity and no shared database; single-use enforced locally with a duplicate-scan cooldown.
- Implemented Stripe checkout with webhook signature verification for automatic issuance, transactional email via Resend, and an organizer dashboard for attendee management.
- Wrote a PyTest suite over ticket integrity, signatures, and scan edge cases, including concurrency tests proving no overselling under 150 simultaneous buyers.

Swatch | *Python, NumPy, scikit-learn, CLIP, Flask, Linux*

Sept. 2026

- Built a clothing recommender in four hours at a hackathon over a self-scraped, CLIP-embedded corpus of 1,762 items from 14 brands; mean-centered it to strip the product-photography component every image shares, cutting mean pairwise similarity from 0.73 to 0.04.
- Modeled taste as up to four k-means clusters scored by best match, rather than one averaged vector, since averaging dissimilar preferences ranks a mediocre hybrid above either liked item.
- Balanced exploration against exploitation by round-robinning the feed across clusters so the strongest cannot starve the rest, plus active learning on items between two tastes and a random wildcard.

TECHNICAL SKILLS

Languages: Python, C++, C, TypeScript, JavaScript, Java, SQL

Backend: FastAPI, REST APIs, PostgreSQL, SQLite, Docker, Linux

Frontend: React, Svelte, HTML/CSS | **Tools:** Git, PyTest, NumPy, scikit-learn, Pandas, LDAP, Samba
